
puppet-php

Release 1.0

Christian Winther

January 04, 2016

1	Why Use puppet-php	3
2	Source code	5
3	License	7
4	Bugs	9
5	Features	11
6	Support / Questions	13

puppet-php is a module for managing PHP using puppet.

Why Use puppet-php

- it's very fast to install, a few minutes tops.
- it supports all PHP SAPIs out of the box.
- it supports a lot of PHP extensions out of the box.
- it's is very flexible and has tons of configuration options, and sane defaults.
- it aims to stay out of your way, and if it happens to get in your way, you can change the undesired behavior very easily.
- it removes the boilerplate code from your manifests, which mean less code to maintain, and less code to spend time unit testing.
- it uses the MIT license.

Source code

The source can be found at github.com/jippi/puppet-php

License

The project is released under the permissive MIT license.

Bugs

If you happen to stumble upon a bug, please feel free to create a pull request with a fix (optionally with a test), and a description of the bug and how it was resolved.

You can also create an issue with a description to raise awareness of the bug.

Features

If you have a good idea for a feature, please join us on IRC and let's discuss it. Pull requests are always more than welcome.

Support / Questions

You can find me on IRC in the #puppet channel on irc.freenode.net for any support or questions. My alias is Jippi
